Coco coir grow bags & slabs

Horizontal row format | Buyer & preparation guide

Coco coir grow bags and slabs provide a horizontal root zone for greenhouse rows, gutter systems and tabletop crop production. Match the expanded slab geometry and substrate structure to the crop and irrigation plan.

Horizontal bag format. Schematic only; no cutting layout or scale implied.

01 CHOOSE THE FORMAT

Specify expanded length, width and height separately from compressed shipping dimensions. Agree on plant spacing, emitter positions, support and drainage. A custom layout is order-specific, not a universal planting recommendation.

02 PREPARE FOR YOUR GROWING SYSTEM

Confirm the layout first
Check slab orientation, gutter or bench fit, planting positions and the agreed drainage pattern before cutting.

Hydrate to the supplied instructions
For a compressed slab, allow even expansion and equilibration. Required water and time depend on the format and source water.

Check before planting
Confirm drainage and wetting uniformity. Use the agreed EC/pH methods and set the nutrient programme for the crop.

03 SEND A USEFUL QUOTATION BRIEF

Crop; gutter or bench dimensions; expanded slab dimensions; bag count; preferred structure; planting/dripper/drainage layout; supplied condition; postal or ZIP code; required date; receiving access.

Washing, buffering and hydration are different steps. Ask for the specification and available laboratory reports for the ordered product or batch. Stock, minimum quantity, packing, price and freight are confirmed by quotation.
